Outline

- Quick platform/architecture intro, introduce main webserver hosting with nginx (daniel)
- Screenshots of outputs embedded in powerpoint show completed workflow outputs - gene prediction (Chloe), ANIclustermap (Charlotte), parsnp (joanne)
- Show screenshots of landing page, uploading, email, job tracking, etc do upload demo (Bhavay)
- Eventually push to GitHub and have flowchart for whole pipeline

Email: team1.webserver@gmail.com password - team1webserver@123

Predictive Webserver Results

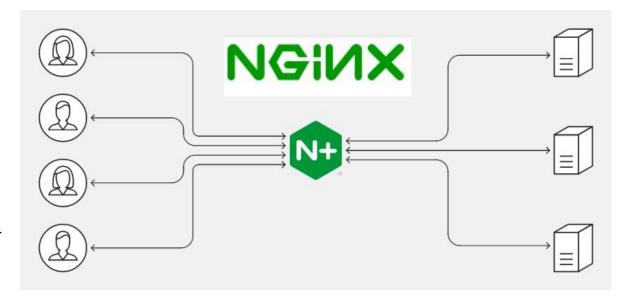

Team 1

Bhavay Aggarwal, Joanne Boysen, Daniel Groves, Chloe Pryor, & Charlotte Royer

NginX: Front-End

NginX

- Open source software for webservers
- Provides HTTP server features
- Mail proxy server features
- Supports our webserver architecture

Webserver Layers

NGINX

- Frontend server
- Reduces load on backend servers
- Reverse proxy between the internet and backend server
- High-performance
- Load-balancing and caching

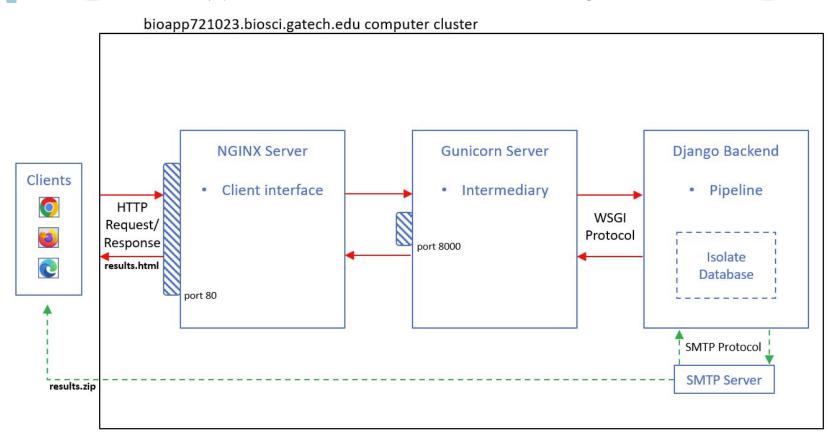

Gunicorn

- Application server
- Necessary when using Python-based frameworks
- Forwards HTTP requests to the web application
- Communicates via WSGI protocol

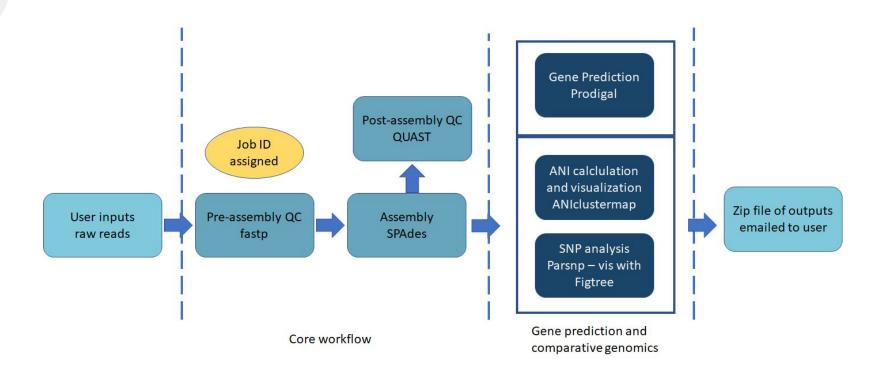

Django

- Backend server
- Processes data, application logic, etc
- Python-based web application framework
- Follows MTV structure for easy data storage, job organization, and presentation
- Processes the raw reads and performs our pipeline

Webserver Architecture

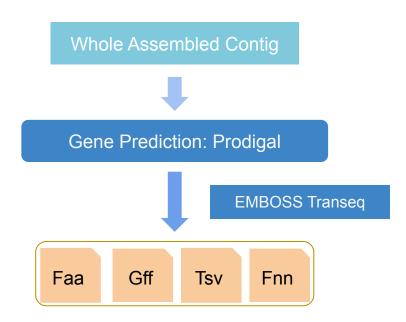

Workflow

Webserver Output 1

Gene Prediction

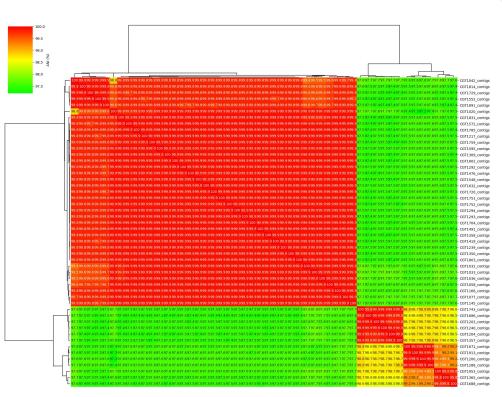

- Chosen tool: Prodigal
- Predicts genes from the assembled contigs (generated with SPAdes)
- Output: fasta and gff files bundled with other outputs in the zip file that is emailed to the user

Webserver Output 2

Comparative Genomics: Whole Genome Analysis

- Chosen tool : ANIclustermap
- Calculates all-against-all ANI between samples using fastANI
- Constructs heatmap visualization for user
- User input genomes are added to the database, and ANIclustermap is run on the entire folder
- Output compares user's input genomes to entire database
- Output is generated as .png and bundled with outputs in zip file

Webserver Output 3

Comparative Genomics: SNP Analysis

Chosen tools: Parsnp and Figtree

- Parsnp excels at rapid core genome mulit-alignment
- Alignment based → fast SNP analysis and microbial core genome phylogeny
- With NCBI Reference Sequence: NZ_CP120944.1, EDL933
- Figtree is a graphical viewer of phylogenetic trees

Outputs included in zip file:

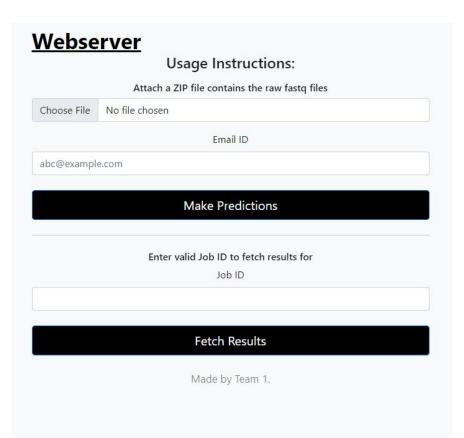

- Figtree phylogenetic tree PNG
- parsnp.tree
 - In case the user would like to visualize the data differently
